Features:

Near real-time locating:

HEAT tags can be programmed to send updates on the actual location of the item being shipped on a pre-programmed frequency and schedule. They can be programmed to change reporting frequency based on motion or at rest. You can view all of your tags' locations via a PC or smartphone/tablet.

Define areas for notification:

This allows you to define a boundary around an address, location, building, city, state, etc. Once the Geofence is established, you can program the tag to send an alert when it enters or exits the Geofence. You can even have the tag monitor how long it is in or out of the Geofence or a speed threshold within that Geofence and send an alert. This is all automated to facilitate communications and notifications.

Know the conditions your items are subject to:

Our tags can monitor the conditions your items are in and send alerts based on values you set. Receive alerts based on temperature, humidity or barometric pressure thresholds. This is especially key for critical electronics, biomedical, and foods.

Theft Protection

Tamper monitoring:

HEAT tags equipped with this feature can monitor for ambient light and infrared light. This allows the tag to send an alert when a container door was opened during transit or a box has been cut to extract the goods inside. These tags also have GPS jamming detectors to know if a thief is attempting to intervene with the signal. Alerts for these conditions are sent to whoever you identify via email or SMS.

Handling

Identify mishandles for insurance claims:

HEAT tags can monitor for material mishandling situations in order to create a documented chain of evidence for insurance claims. The tags have the ability to monitor and measure g-force impacts as well as tilt/roll conditions. Not only can the data facilitate the claim, the immediate notification during transit will allow you to create a more immediate remediation plan.

Motion

Notifications for goods on the move:

HEAT tags can monitor for motion, alerting you to conditions when your items may be subject to theft or tampering. Receive notifications for any movement detected, or program them to send an alert when they exceed a certain speed.

Personnel

Better insight—improved operations:

Utilizing the smart appliance tracking software on a tablet or smartphone will allow you to gain valuable insight into the productivity of your field team. Immediately know their locations in relation to a service call; track their driving behaviors and automate mileage reports. Know when they arrive and depart a service location and allow the alerts to automate customer notifications.
